

Why Go CI/CD?

Kiersten Raymond

Reduce Cost

By utilizing CI/CD tools and concepts, developers are able to more accurately troubleshoot and diagnose errors after merging. This results in less time developers spend on collaboration issues.

Reduce Cost

Another way we'll be tackling cost reduction is having automated infrastructure cleanup. With this process being automated, we will have less costs from unused resources.

Avoid Cost

By developing unit and integration tests, we will be able to catch failures and therefore have less bugs in production and even less testing once development is complete.

Protect Revenue

With our smoke tests and rollback on failure automatic triggers, we can reduce potential downtime and quickly undo anything that was done to return us to a stable state.
